Feb 2022

# Measuring political media slant with text data

---

- ▶ Media affects electoral outcomes (e.g., Adena et al. 2015; Enikolopov et al. 2011)
- ▶ **Context:** Singapore
- ▶ **Question:** Is *The Straits Times* (flagship print media) less *accurate* when quoting parliamentary speeches of the opposition? **Yes**
- ▶ **Prior work**
  - Measures of *coverage intensity* (e.g., Groseclose and Milyo 2005; Gentzkow and Shapiro 2010)
- ▶ **This paper:**
  - Develops a notion of coverage (quotation) accuracy
  - OLS  $\leftrightarrow$  ML + NLP
  - Text as data to deal with competing explanations (methodological)

## Preview: Results

---

- ▶ Unit of analysis: Direct quotations of parliament speeches in news articles
- ▶ **Dependent** variable: Quotation accuracy
- ▶ **Treatment** variable: Opposition status of politicians
- ▶ Quotation accuracy for opposition is lower

# Context: Politics & Media in Singapore

- ▶ Parliamentary democracy
- ▶ Ruling party—dominant party since 1959
- ▶ Opposition party—broke through in recent years
- ▶ Since 2006—present: Opposition accounted for  $\sim 5$ –10 of 100 seats

## People's Action Party (Ruling):

## Worker's Party (Opposition):

# Context: Politics & Media in Singapore

- ▶ *The Straits Times*
- ▶ Flagship + newspaper of record
- ▶ (Perceived) Ties to the Ruling party via media-related regulations:
  - Newspaper and Printing Presses Act (NPPA)
  - Internal Security Act, Official Secrets Act, Sedition Act, Protection from Online Falsehoods and Manipulation Act\*

Print:

Digital:

# Text as Data

## ► Text data on (direct) quotes:

- *The Straits Times*, 2005–16 from Factiva

## ► Text data on parliament speeches:

- Transcripts from Official Online Repository (Hansard)

## ► Obtaining the data:

- Small scale: Hand-code news articles
- Large scale: Supervised ML

## ► Final panel (12 years from 2005–16):

- 3,425 news articles (from an initial 62,132)
- 5,130 parliament speeches

## Scoring quote accuracy example 1

---

**Parliament speech:** . . . . . The Workfare Bonus marks a significant step because it provides low-wage workers with a cash bonus. If you work, you get the cash bonus at the end of the year, twice - this year based on 2005 work, next year based on 2006 work. It is a once-off scheme because this is the first time we are doing it. Payments will be for two years. We should **experiment and gain experience** with the scheme first, before considering whether we need a more permanent work-based assistance scheme like this, and if so, what form it should take. . . . .

**Quote from news article:**  
The Government would 'experiment and gain experience' with the scheme first, he said.

**Substring accuracy:**  
100/100

## Scoring quote accuracy example 2

---

**Parliament speech:** . . . . . So, let us not take our harmonious social fabric for granted because **the alternative may be too painful to endure**. This is one pillar of success that we must continue to invest in, especially as we embark on our next lap of development. . . . .

**Quote from news article:**  
He said Singaporeans should not take racial harmony for granted because 'the alternative will be too painful to endure'

**Substring accuracy:** 84/100

[More examples](#)

# Text as Data (1/3): Scoring quote accuracy

speech  
substring  
of length  $m$

**Substring accuracy:**  $\mathcal{F}(q, s) = \max_i \left\{ \underbrace{f(q, s^{(i:i+m-1)})}_{\text{edit distance b/w quote \& substring}} \mid \underbrace{i \in \{1, \dots, n - m + 1\}}_{\text{all possible starting positions for an m-length substring}} \right\}$

- $q$  = quote of length  $m$
- $s$  = speech
- $i$  = substring start position
- $f$  is the base edit distance scorer (e.g. Levenshtein distance).

# Empirical approach: OLS

---

- ▶ Unit of analysis: Speech-quote pairs
- ▶ **Dependent** variable: Quotation accuracy
- ▶ **Treatment** variable: Opposition status of politicians
- ▶ **Quotation accuracy:**
  - Out of 100 points
  - **Opposition** politicians get quoted **1.5~2.4 points** (1.6% to 2.5%) less accurate)
- ▶ No difference in coverage intensity

# Text as Data (2/3)

Three alternative interpretations of OLS estimates.

## 1. Political topics of speeches

Topic distributions of speeches & news articles (Unsupervised ML, LDA)

*<cpf, retirement, minimum\_sum, saving, cpf\_saving>*

*<police, home\_team, officer, crime, inquiry>*

*<premium, medishield\_life, medishield,insurance, insurer>*

*<student, school, learn, education, teacher>*

*<fare, bus, public\_transport, commuter, operator>*

Intertopic Distance Map (via multidimensional scaling)

### 2. Usage of trivial words (stopwords, e.g. "how", "you", "it", "a", "now")

- Alternative accuracy measures: Remove stopwords in pre-processing

### 3. Government & opposition speeches are different

- Language grade/*readability*
- Language sophistication/*lexical richness*  
(<https://github.com/lsys/lexicalrichness>, Shen 2022)
- Speech objectivity & polarity

# Empirical specification

$$\text{quote accuracy}_{irst} = \underbrace{\sum_{k=2006}^{2016} \alpha_k \text{year}_{kt}}_{\text{year fixed effects}} + \underbrace{\sum_{\ell=11}^{13} \alpha_{\ell} \text{parl}_{\ell t}}_{\text{parliament term fixed effects}} + \underbrace{\beta \text{opposition}_i}_{\substack{= 1 \text{ if politician } \\ i \text{ is from an } \\ \text{opposition party}}} + \gamma \mathbf{X}_{irst} + \varepsilon_{irst} \quad (1)$$

- ▶  $i$  = politicians
- ▶  $r$  = article
- ▶  $s$  = speech
- ▶  $t$  = article-speech date
- ▶  $\mathbf{X}$  is the vector of controls
- ▶ Standard errors adjusted for clusters by news article

List of Controls

	Log of quote length by word count		Substring accuracy measure		Bag-of-words accuracy measure	
	(1)	(2)	(3)	(4)	(5)	(6)
Opposition	-0.138*** (0.047)	-0.145*** (0.055)	-1.455** (0.701)	-1.485** (0.753)	-2.434*** (0.707)	-2.271*** (0.675)
<b>Controls</b>						
Time fixed-effects	Yes	Yes	Yes	Yes	Yes	Yes
Individual controls	Yes	Yes	Yes	Yes	Yes	Yes
Article controls	Yes	Yes	Yes	Yes	Yes	Yes
Topic controls	Yes	Yes	Yes	Yes	Yes	Yes
Ministerial controls	Yes	Yes	Yes	Yes	Yes	Yes
Electoral controls	—	Yes	—	Yes	—	Yes
<b>F-statistics</b>						
F-stat, time fixed-effects	3.090***	2.050**	5.229***	3.189***	5.125***	2.501***
F-stat, individual controls	1.104	1.379	2.027**	0.902	2.055**	0.742
F-stat, topic controls	2.412***	2.290***	2.106***	2.078***	1.608***	1.459***
F-stat, ministerial controls	3.901***	3.997***	3.904***	3.964***	2.865***	2.180***
F-stat, electoral controls		1.096		0.990		1.264
R <sup>2</sup>	0.056	0.068	0.171	0.197	0.113	0.124
Observations	14,887	10,900	14,887	10,900	14,887	10,900

Robust standard errors adjusted for clusters by news article in parentheses. \*\*\* Significant at the 1 per cent level. \*\* Significant at the 5 per cent level. \* Significant at the 10 per cent level.

## Results:

- **Opposition quote** is 1.5 points **less accurate** (relative to ruling party politicians)
- Alternative measure (via BoW) leads to similar conclusions
- No difference in coverage intensity

Article-speech level results

► **Bounding arguments:**

- Selection on observables and unobservables (Altonji et al. 2005; Oster 2017)
  - Data suggest degree of selection on unobservables relative to observables must be very high (58 or 16 times more) for differences to be zero ( $\beta = 0$ )
- Even if opposition/party status is random, a compositional bias (Angrist and Pischke 2009) suggests that OLS estimates are lower bounds in magnitude

► **Robustness:**

- Author & beat FEs
- Dropping translated quotes
- Alternative clustering by speech and author
- Alternative topic distributions of speech and news articles
- Exclusion of stopwords (e.g. "a", "and", "how")
- Controls for language competency and speech tone
  - Language grade/*readability*
  - Language sophistication/*lexical richness*
  - Speech objectivity and polarity

# Mechanism: Media engagement strategy

## ► Interview stakeholders:

- Senior journalist from political desk
- Member of parliament(s)

## ► Rational choice in a separating equilibrium:

- Choice: Advance circulation of transcript
- Cost: Spin
- Benefit: Higher quote accuracy

## ► Separating equilibrium implies private beliefs about slant

## Logistics

- Ruling party circulate speech transcripts in advance to the media
- Opposition do not
- Explains differences in accuracy

## Recap & Closing

---

- ▶ Context: Singapore where slant is subdued
- ▶ Text data reveals subtle political media slant  
(E.g. Groseclose and Milyo 2005; Bernhardt et al. 2008; Ho and Quinn 2008; Sutter 2012)
- ▶ Consequences of quotation inaccuracy?
- ▶ **Methodological contributions:**
  - Using both supervised & unsupervised learning
    - Supervised ML expedites data parsing
    - Unsupervised learning annotates data free from bias
  - NLP methods: quantify quotation accuracy
    - Accuracy vs. intensity
    - Accuracy is also less subject to OVB

Thank you!

## Data: Scoring quote accuracy example 3

**Parliament speech:** Mr Speaker, Sir, in the course of this debate, I may have misheard certain things and if I misquoted the Members, let me apologise. Mr Low asked whether the GIC money is derived from CPF money. The relationship is not so simple. Let me give an example. You put money in the bank, and you agree that you put it there and you get 2%. The bank publishes a report and says that of all its earnings, it earned 8%. You go to the bank and say you want 8%, it does not work. MOF has **taken on our liabilities**. What MOF does with its money is MOF's consideration but . . . . .

**Quote from news article:**

. . . . . Dr Ng said that, in fact, the Ministry of Finance (MOF) has '**taken our liabilities**', meaning that MOF bears the risk of losing the money if investments fail.

**Substring accuracy:** 86

**Bag-of-words accuracy:** 100

## Data: Scoring quote accuracy example 4

**Parliament speech:** . . . . . In my view, this amendment is a **half-baked** Bill which seemingly can solve the employment issue before people are allowed to take out their CPF savings, yet in reality, it cannot guarantee that Singaporeans will continue to be employed until the age of 65, only by then can they take out their CPF savings. . . . .

**Quote from news article:**  
Speaking during the debate on the Retirement and Re-Employment Act yesterday, Mr Low criticised the new law as **'half-cooked'**.

**Substring accuracy:** 73

**Bag-of-words accuracy:** 53

## Data: Quote Accuracy Measure 2

The 2nd accuracy measure (using **common words**) is:

$$\mathcal{F}_2(q, s) = \max\left\{f(\tilde{q}, \tilde{s}), f(\tilde{q}, \tilde{C}), f(\tilde{s}, \tilde{C})\right\},$$

where

- ▶  $\tilde{C}$  is the sorted set of common words appearing in both quote and speech.
- ▶  $\tilde{q}$  and  $\tilde{s}$  are the sorted strings of quote and speech.
- ▶  $f$  is the base edit distance scorer (e.g. Levenshtein distance).

**A. Individual controls**

Age	Quadratic for age of politician
Tenure	Quadratic for political tenure of politician
Gender	$\in \{\text{Male, Female}\}$
Race	$\in \{\text{Chinese, Indian, Malay, Eurasian/others}\}$

---

**B. Ministerial controls**

Politician type	$\in \{\text{PM, DPM, Ministers, SPS, Parl Sec, Mayor, Speaker, SMS, MOS, MP, NCMP, NMP}\}$
Ministry portfolio	$\in \{\text{Comms, CCY, Defence, Education, Finance, Foreign, Health, Home, Law, Manpower, National Development, EWR, Trade \& Industry, Transport, PMO}\}$

---

**C. Electoral controls**

Constituency size	$\in \{1, 4, 5, 6\}$
Voters	Eligible voters in the constituency
Votes	Number of votes won in the constituency
Votes (%)	Percentage of votes won in the constituency
Winner's margin	Number of winner's vote - number of loser's vote
Winner's margin (%)	Ratio of winner's margin to voters

---

**D. Topic controls** (from *Latent Dirichlet Allocation* (LDA))

Speech	vector of $K = 92$ probabilistic topic association
Quote	vector of $K = 92$ probabilistic topic associations
Newspaper Article	vector of $K = 40$ probabilistic topic associations

---

**E. Article controls**

Day of week	$\in \{\text{Mon, Tue, Wed, Thu, Fri, Sat, Sun}\}$
Section	$\in \{\text{Singapore, Prime News, Top of the News, Home, ST, Insight, News, Money, Think, Review- Insight, Sports, Opinion, World, Others}\}$
Translation	$= 1$ if speech $s$ was translated from a vernacular to English

---
